Jonathan Amy Facility for Chemical Instrumentation

The Amy Instrumentation Facility (JAFCI) is dedicated to the fusion of engineering expertise with the quest for scientific knowledge to further research and instructional efforts in the Department of Chemistry and School of Chemical Engineering at Purdue University. Our team of scientists and engineers provide assistance in the design / construction of specialized instrumentation not commercially available along with repair / modification of commercial systems.

Instrument Shop

For over 16 years the professional research Instrument Shop at the Department of Chemical and Biological Engineering has provided mechanical and electrical design and fabrication services at CU Boulder. The experienced staff provides solutions for instructional and research needs for any department or college at highly competitive rates. The Instrument Shop is collectively comprised of a machine shop and electronics shop, both of which are located in the basement level of the Jennie Smoly Caruthers Biotechnology Building.

In short, the shop's primary mission is to help the labs and researchers get the custom tools and instruments they need to successfully complete their projects, from problem to solution. Contact the shop staff with the details of your project.

ABSTRACT: Adoption of commercial photoreactors as standards for photocatalysis research could be limited by high cost. We report the development of the Wisconsin Photoreactor Platform (WPP), an open-source photoreactor architecture potentially suitable for general adoption. The WPP integrates inexpensive commercial components and common high-intensity LEDs in a 3D-printed enclosure. Dimensions and features of WPP reactors can be readily varied and configurations easily reproduced. WPP performance is evaluated using literature transformations driven by light of disparate wavelengths.

Supporting Information

ABSTRACT: In this work, we present the Wisconsin Oscillator, a small, inexpensive, low-power circuit for powering ion-guiding devices such as multipole ion guides, ion funnels, active ion-mobility devices, and non-mass-selective ion traps. The circuit can be constructed for under \$30 and produces two antiphase RF waveforms of up to 250 V_{P-P} in the high kilohertz to low megahertz range while drawing less than 1 W of power. The output amplitude is determined by a 0–6.5 VDC drive voltage, and voltage amplification is achieved using a resonant LC circuit, negating the need for a large RF transformer. The Wisconsin Oscillator automatically oscillates with maximum amplitude at the resonant frequency defined by the onboard capacitors, inductors,

Open hardware: From DIY trend to global transformation in access to laboratory equipment

Tobias Wenzel  *

Institute for Biological and Medical Engineering, Schools of Engineering, Medicine and Biological Sciences, Pontificia Universidad Católica de Chile, Macul, Región Metropolitana, Chile

* tobias.wenzel@uc.cl

Abstract

Open hardware solutions are increasingly being chosen by researchers as a strategy to improve access to technology for cutting-edge biology research. The use of DIY technology is already widespread, particularly in countries with limited access to science funding, and is catalyzing the development of open-source technologies. Beyond financial accessibility, open hardware can be transformational for the access of laboratories to equipment by

Conclusion

Two categories of electrical hazard:

- ▶ electrocution
- ▶ fire

Blaise Thompson

Research Shops

Custom Research
Electronics

Appliance
Maintenance

Safety
Electrocution

Fire
Examples

Conclusion

Relatively small amounts of current can be very dangerous!

- ▶ 1 mA - barely perceptible
- ▶ 16 mA - maximum current an average person can grasp and “let go”
- ▶ 20 mA - paralysis of respiratory muscles
- ▶ 100 mA - ventricular fibrillation threshold
- ▶ 2000 mA - cardiac standstill and internal organ damage
- ▶ 15000 mA - fuse / breaker opens circuit

A typical LED draws 20 mA.

Fuses and breakers will NOT protect you from death by electrocution!

Electronics

Appliance
Maintenance

Safety
Electrocution
Fire
Examples

Conclusion

Most resistance is at the skin.

Resistance **decreases** significantly if your skin is **wet**.

Typical Voltages

Treat anything above 30 V as an electrocution hazard.

- ▶ 5 V - USB power supply
- ▶ 120 V - typical lab appliance
- ▶ 120 V - typical vacuum roughing pump
- ▶ 50 to 200 V - gel electrophoresis
- ▶ 1000 V - piezoelectric actuators
- ▶ 1000 V - photomultiplier tubes
- ▶ 3000 V - electron / ion multipliers
- ▶ 15000 V - X-Ray sources

Typical Voltages

Voltage is not necessarily dangerous,

Know the current rating!

Electronics

Appliance
Maintenance

Safety

Electrocution

Fire

Examples

Conclusion

Designed specifically for shock protection.

Ensure that no current is leaking out of circuit.
Sensitive to a few mA.

Will trip if used with large inductive loads (motors).

Prone to weaken over time—replaced every ten years.

Liquids and Shock Hazard

Avoid mixing water and electricity.

- ▶ Minimize the use of electrical equipment in cold rooms or other areas where condensation is likely. If equipment must be used in such areas, mount the equipment on a wall or vertical panel.
- ▶ If water or a chemical is spilled onto equipment, shut off power at the main switch or circuit breaker and unplug the equipment.

Blaise Thompson

Research Shops

Custom Research

Appliance
Maintenance

Safety

Electrocution

Fire

Examples

Conclusion

When an electrical circuit fails it can rapidly cause sparks and get very hot.

When combined with chemicals, this situation can become explosive.

Even low voltage circuits are capable of getting very hot.
Power is product of voltage and current.

Recommendations for Avoiding Electrical Fire

Ensure that circuits are not overloaded.

- ▶ Recognize which devices are drawing a lot of power.
 - ▶ Heaters, ovens
 - ▶ Pumps
 - ▶ Motors
- ▶ Be aware which devices share a circuit.
- ▶ Never use extension cords or power strips.

Recommendations for Avoiding Electrical Fire

Use good housekeeping.

- ▶ Do not crowd multiple appliances into small spaces.
- ▶ Regularly inspect power cords for damage.
- ▶ Keep appliances clean, free from chemical buildup.
- ▶ Dispose of broken appliances quickly.

Recommendations for Avoiding Electrical Fire

Protect against catastrophic failure.

- ▶ Ensure that devices have fuses and/or breakers.
- ▶ When designing heating systems, consider incorporating thermal fuses.
- ▶ Ground exposed metal.
